

“ My silage *stability*
was improved
of 75 hours in comparison
to untreated silage ”

COMPANY DESCRIPTION

STARA RACA, CROATIA

Name of farm: VETKOOP

Farm Manager Name:
Mr. Pavi i

1000 bulls

“We decided to test Sil-All Maize+, even though we were skeptical about benefits of silage additives on corn silage. To better challenge it, only one of our two silos has been treated. We opened them after 3 weeks and results were obvious: on the treated bunker, there was less heat being exuded and much less water running off. And laboratory analysis confirmed it: the treated bunker had less nutrient losses and silage stability was improved of 75 hours in comparison to untreated silage. Now that we tested it, we would certainly recommend Sil-All Maize+.”
